

# Case Study: MBTA

Sonia Mazzi

13 November, 2019

# CASE STUDY Massachusetts Bay Transport Authority (MBTA) data from an Excel file

Data on transportation data in Boston, USA: monthly averages of weekday number of passengers (in thousands) by mode of transportation.

A snapshot of part of the data (not all columns are included), in Excel format, is below.

	A	B	C	D	E	F	G	H	I	J	K	L	M
1	MBTA Avg Weekday Unlinked Passenger Trips (thousands)												
2	mode	2007-01	2007-02	2007-03	2007-04	2007-05	2007-06	2007-07	2007-08	2007-09	2007-10	2007-11	
3	1 All Modes by Qtr	NA	NA	1187.653	NA	NA	1245.959	NA	NA	1256.571	NA	NA

## ...
```

- ▶ Variables are mode of transportation, year, month and monthly average number of passengers.
- ▶ All column names, except for the first one, mode, are values of year and month combined.
- ▶ To correct this we use the `pivot_longer()` function

```
#gather column names, except first one, into "year_month"  
#with the corresponding value in the column "NrPassengers"  
#  
mbta3 <- pivot_longer(mbta2, -1, names_to = "year_month",  
                      values_to = "NrPassengers")
```

```
glimpse(mbta3)
```

```
## Observations: 464
## Variables: 3
## $ mode      <chr> "Boat", "Boat", "Boat", "Boat", "Boat", "Boat", "...
## $ year_month <chr> "2007-01", "2007-02", "2007-03", "2007-04", "2007...
## $ NrPassengers <dbl> 4.000, 3.600, 40.000, 4.300, 4.900, 5.800, 6.521,...
```

- ▶ `year_month` has values of 2 variables. Keep the year in one column and month in another column.
- ▶ Separate them using the `separate()` function.

```
mbta4 <-  
  separate(mbta3, "year_month", c("year", "month"), sep = "-")  
  
mbta4 <- mutate_at(mbta4, c("year", "month"), as.numeric)  
  
glimpse(mbta4)  
  
## Observations: 464  
## Variables: 4  
## $ mode      <chr> "Boat", "Boat", "Boat", "Boat", "Boat", "Boat", "...  
## $ year      <dbl> 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2...  
## $ month     <dbl> 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 1, 2, 3, 4...  
## $ NrPassengers <dbl> 4.000, 3.600, 40.000, 4.300, 4.900, 5.800, 6.521,...
```

We can tidy the data in one go using the `%>%` operator.

```
mbta_tidy <- mbta %>%  
  select(-1) %>%  
  slice(-c(1, 7, 11)) %>%  
  pivot_longer(-1, names_to = "year_month",  
               values_to = "NrPassengers") %>%  
  separate("year_month", c("year", "month"), sep = "-") %>%  
  mutate_at(c("year", "month"), as.numeric)  
  
glimpse(mbta_tidy)
```

```
## Observations: 464  
## Variables: 4  
## $ mode      <chr> "Boat", "Boat", "Boat", "Boat", "Boat", "Boat", "...  
## $ year      <dbl> 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2...  
## $ month     <dbl> 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 1, 2, 3, 4...  
## $ NrPassengers <dbl> 4.000, 3.600, 40.000, 4.300, 4.900, 5.800, 6.521,...
```

- ▶ The data is tidy and ready to be explored.

## Using ggplot2 to visualise data

```
library(ggplot2)
```

ggplot2 is based on “The Grammar of Graphics”.

# Using ggplot2

Picture from

<https://medium.com/tdebeus/think-about-the-grammar-of-graphics-when-improving-your-graphs-18e3744d8d18>

- ▶ The function `ggplot()`, in the package `ggplot2`, is used to visualise data.
- ▶ The basic use is

```
ggplot(myData, aes = (myMapping)) + myGeometryLayer
```

- ▶ **mydata**: data frame with variables to use in plot.
- ▶ **myMapping**: mapping from the data to the aesthetics (visual dimension) in the graph. For example, the mapping can be `x = Varx, y = Vary` for a scatter plot of `Vary` vs. `Varx`.
- ▶ **myGeometryLayer**: specify what you want, points, lines, boxes, etc. e.g.: `geom_point()` for a scatter plot, `geom_line` for a line plot, etc.
- ▶ One can add many layers to the basic `ggplot` object created with the `ggplot()` function.

```
ggplot(mbtata_tidy, aes(x = mode , y = NrPassengers, color = mode)) +
  geom_boxplot() +
  labs(y = "Average weekday number of passesgers (1000s)") +
  ggtitle("Boxplots of average number of passengers by travel mode")
```

- ▶ Most trips were made by heavy rail, bus, light rail and commuter rail, in descending order.
- ▶ Number of passengers are on a different scale for boat, private bus and trackless trolley. Plot them separately

```

aux <- filter(mode_ride, mode != "Boat", Private Bus, RIDE, Trackless Trolley)
ggplot(aux, aes(x = mode, y = NrPassengers, color = mode)) +
  geom_boxplot() +
  labs(y = "Average weekday number of passengers (1000s)") +
  ggtitle("Boxplots of average number of passengers by boat, private bus, car and trackless trolley")

```

##

```

filter(mbt_a_tidy, mode %in% c("Boat", "Private Bus", "RIDE", "Trackless Trolley")) %>%
ggplot(aes(x = mode , y = NrPassengers, color = mode)) +
  geom_boxplot() +
  labs(y = "Average weekday number of passesgers (1000s)") +
  ggtitle("Boxplots of average number of passengers by boat, private bus, car and trackless trolley")

```

- ▶ There is a very large observation for Boat. Let us find out when it was observed.

```
#Recall %>% passes the output of the left expression  
#as input of the right expression  
#top_n(1, NrPassengers) selects the top n=1 rows,  
#ordered by NrPassengers  
#  
mbta_tidy %>% filter(mode == "Boat") %>% top_n(1, NrPassengers)
```

```
## # A tibble: 1 x 4  
##   mode   year month NrPassengers  
##   <chr> <dbl> <dbl>         <dbl>  
## 1 Boat   2007     3             40
```

- ▶ The unusual observation occurred in March 2007.

- Look at the distribution of the other values of number of passengers who traveled by boat

```
mbta_tidy %>% filter(mode == "Boat", NrPassengers < 40) %>%  
  select(NrPassengers) %>% summary()
```

```
##    NrPassengers  
##  Min.      :2.985  
##  1st Qu.:3.488  
##  Median :4.285  
##  Mean    :4.455  
##  3rd Qu.:5.189  
##  Max.    :6.733
```

- ▶ No big event happened in Boston in March 2007.
- ▶ It's quite likely the person who entered the data added an extra zero.
- ▶ Change this value to 4. Check with data originators and report.

```
mbta_tidy <- mbta_tidy %>%  
  mutate(NrPassengers =  
    replace(NrPassengers, mode=="Boat" & NrPassengers==40, 4))
```

Alternatively, one can use

```
mbta_tidy <- mbta_tidy %>%  
  mutate(NrPassengers =  
    if_else(mode=="Boat" & NrPassengers==40, 4, NrPassengers))
```

- ▶ Let us see the boxplots again

```

aux <- filter(mbt_a_tidy, mode %in% c("RIDE", "Boat", "Private Bus", "Trackless Trolley"))
ggplot(aux, aes(x = mode , y = NrPassengers, color = mode)) +
  geom_boxplot() +
  labs(y = "Average weekday number of passesgers (1000s)") +
  ggtitle("Boxplots of average number of passengers by boat, private bus, car and trackless trolley")

```

Boxplots of average number of passengers by boat, private bus, car and trackless trolley

```

filter(mbt_a_tidy, mode %in% c("RIDE", "Boat", "Private Bus", "Trackless Trolley")) %>%
ggplot(aes(x = mode , y = NrPassengers, color = mode)) +
  geom_boxplot() +
  labs(y = "Average weekday number of passengers (1000s)") +
  ggtitle("Boxplots of average number of passengers by boat, private bus, car and trackless trolley")

```

- ▶ There are some unusually low values for the number of passengers travelling by trackless trolley.
- ▶ Find out when they occurred.

```
#top_n(-8) gives bottom 8 rows
#arrange() sorts the rows of a tibble by ascending order of vector
#
mbta_tidy %>% filter(mode == "Trackless Trolley") %>%
  top_n(-8, NrPassengers) %>% arrange(NrPassengers)
```

```
## # A tibble: 8 x 4
##   mode          year month NrPassengers
##   <chr>        <dbl> <dbl>         <dbl>
## 1 Trackless Trolley 2010    12          5.78
## 2 Trackless Trolley 2010     8          6.32

## 4 Trackless Trolley 2010     9          6.44
## 5 Trackless Trolley 2010     7          6.58
## 6 Trackless Trolley 2010    10          6.82
## 7 Trackless Trolley 2009     2          9.64
## 8 Trackless Trolley 2011     7         11.1
```

- ▶ The unusually low observations for trackless trolley occurred in the second semester of 2010.
- ▶ Don't change or delete, but be aware.

- ▶ Plot numbers of passengers against time.
- ▶ Create a new variable, date, with the lubridate package function `make_date()`

```
library(lubridate)
```

```
#create and append the new variable date
#
mbta_tidy <- mutate(mbta_tidy, date = make_date(year, month))

head(mbta_tidy)
```

```
## # A tibble: 6 x 5
##   mode   year month NrPassengers date
##   <chr> <dbl> <dbl>         <dbl> <date>
## 1 Boat   2007     1             4 2007-01-01
## 2 Boat   2007     2            3.6 2007-02-01
## 3 Boat   2007     3             4 2007-03-01
## 4 Boat   2007     4            4.3 2007-04-01
## 5 Boat   2007     5            4.9 2007-05-01
## 6 Boat   2007     6            5.8 2007-06-01
```

```
ggplot(mbtta_tidy, aes(x = date, y = NrPassengers, col = mode)) +  
  geom_line() +  
  geom_point() +  
  labs(y = "Number of Passengers (thousands)")
```

- ▶ Different scales for the data corresponding to the number of passengers travelling by boat, RIDE, trackless trolley and private bus.

**EXERCISE:** Describe the time trends for Number of Passengers.

Produce two figures:

- ▶ one with time plots (Number of passengers vs. time) for “Bus”, “Commuter Rail”, “Heavy Rail”, “Light Rail”;
- ▶ the other figure with time plots for “Boat”, “Private Bus”, “RIDE”, “Trackless Trolley”.

**Hint:**

- ▶ First subset the tidy tibble `mbta_tidy` by selecting the appropriate rows.
- ▶ Then use `ggplot(data, mapping) + geometries`.
- ▶ You can do both steps above in one using `%>%`

```
#select rows for boat, RIDE, trackless trolley, private bus  
#  
mbta5 <- filter(mbta_tidy, mode %in% c("Boat", "Private Bus", "RIDE",  
                                     "Trackless Trolley"))
```

```
ggplot(mbtas5, aes(x = date, y = NrPassengers, col = mode)) +  
  geom_line() +  
  geom_point() +  
  labs(y = "Number of Passengers (thousands)")
```

Using the pipe operator (avoids creating mbta5)

```
mbta_tidy %>%
  filter(mode %in% c("Boat", "Private Bus", "RIDE", "Trackless Trolley")) %>%
  ggplot(aes(x = date, y = NrPassengers, col = mode)) +
  geom_line() + geom_point() +
  labs(y = "Number of Passengers (thousands)")
```

- ▶ Strong seasonal component in number of passengers travelling by boat.
- ▶ The use of RIDE seems to be steadily increasing during time.
- ▶ The use of private bus and trackless trolley had a sharp decrease since 2009 and something unusual made the use of trackless trolley dramatically decrease in the second half of 2010.

```
mbta6 = filter(mbtatidy, mode %in% c("Bus", "Commuter Rail", "Heavy Rail", "Light Rail"))
ggplot(mbtatidy, aes(x = date, y = NrPassengers, col = mode)) +
  geom_line() +
  geom_point() +
  labs(y = "Number of Passengers (thousands)")
```

Using the pipe operator

```

mbta_tidy %>%
  filter(mode %in% c("Bus", "Commuter Rail", "Heavy Rail", "Light Rail")) %>%
  ggplot(aes(x = date, y = NrPassengers, col = mode)) +
  geom_line() + geom_point() +
  labs(y = "Number of Passengers (thousands)")

```

- ▶ The number of passengers travelling by light and commuter rail has decreased since 2009.
- ▶ There seems to be an upwards trend on number of passengers travelling by heavy rail and perhaps by bus as well.

# Bar plots

```
glimpse(mbta_tidy)
```

```
## Observations: 464
## Variables: 5
## $ mode      <chr> "Boat", "Boat", "Boat", "Boat", "Boat", "Boat", "...
## $ year      <dbl> 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2...
## $ month      <dbl> 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 1, 2, 3, 4...
## $ NrPassengers <dbl> 4.000, 3.600, 4.000, 4.300, 4.900, 5.800, 6.521, ...
## $ date       <date> 2007-01-01, 2007-02-01, 2007-03-01, 2007-04-01, ...
```

month is numeric. Let us turn it into a factor.

```
mbta_tidy <- mbta_tidy %>%
  mutate(month = as.factor(month))
```

```
glimpse(mbta_tidy)
```

```
## Observations: 464
## Variables: 5
## $ mode      <chr> "Boat", "Boat", "Boat", "Boat", "Boat", "Boat", "...
## $ year      <dbl> 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2007, 2...
## $ month      <fct> 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 1, 2, 3, 4...
## $ NrPassengers <dbl> 4.000, 3.600, 4.000, 4.300, 4.900, 5.800, 6.521, ...
## $ date       <date> 2007-01-01, 2007-02-01, 2007-03-01, 2007-04-01, ...
```

- ▶ In the next plot we will group the data by mode and month,
- ▶ for each subgroup we compute the average number of passengers, and store the values in the column `average_nr_passengers`.
- ▶ Pass this tibble on to `ggplot()` via `%>%` to produce a barplot of averages of number of passengers by month and mode of transportation.

The data is

```
grouped_averages <- mbta_tidy %>%  
  group_by(mode, month) %>%  
  summarize(average_nr_passengers = mean(NrPassengers))
```

```
grouped_averages %>%
```

```
ggplot(aes(x = month, y = average_nr_passengers, fill = mode)) +  
geom_bar(stat = "identity")
```

Next the same but just for "Boat".

```
boat_data <- mbta_tidy %>%  
  group_by(mode, month) %>%  
  summarize(average_nr_passengers = mean(NrPassengers)) %>%  
  filter(mode == "Boat")
```

or

```
boat_data <- grouped_averages %>%  
  filter(mode == "Boat")
```

```
boat_data %>%
```

```
ggplot(aes(x = month, y = average_nr_passengers, fill = mode)) +  
geom_bar(stat = "identity")
```

- ▶ We can flip the chart and add labels with the number corresponding to the length of the bar.
- ▶ To achieve this add the layer `coord_flip()` to your ggplot.

```
boat_data %>%
  ggplot(aes(x = month, y = average_nr_passengers)) +
  geom_bar(fill = "steelblue", stat = "identity") + coord_flip() +
  geom_text(aes(label=round(average_nr_passengers, 2)), position = position_stack(0.9), color="white")
```

# EXERCISE

In the bar plot with all the modes of transportation we see that there isn't that much variability in the average number of passengers by month. However, when we look at the average number of passengers who travel by boat we see that the number is much higher in the summer months.

Recall the issue about scales.

Produce two figures with barplots of average number of passengers for

- ▶ “Bus”, “Commuter Rail”, “Heavy Rail”, “Light Rail”;
- ▶ “Boat”, “Private Bus”, “RIDE”, “Trackless Trolley”.

The data for the plots are

```
BPRT <- mbta_tidy %>%  
  group_by(mode, month) %>%  
  summarize(average_nr_passengers = mean(NrPassengers)) %>%  
  filter(mode %in% c("Boat", "Private Bus", "RIDE", "Trackless Trolley"))
```

```
BCHL <- mbta_tidy %>%  
  group_by(mode, month) %>%  
  summarize(average_nr_passengers = mean(NrPassengers)) %>%  
  filter(mode %in% c("Bus", "Commuter Rail", "Heavy Rail", "Light Rail"))
```

BPRT %>%

```
ggplot(aes(x = month, y = average_nr_passengers, fill = mode)) +  
  geom_bar(stat = "identity") + coord_flip() +  
  geom_text(aes(label=round(average_nr_passengers, 2)), position = position_stack(0.5))
```

BCHL%>%

```
ggplot(aes(x = month, y = average_nr_passengers, fill = mode)) +  
  geom_bar(stat = "identity") + coord_flip() +  
  geom_text(aes(label=round(average_nr_passengers, 1)), position = position_stack(0.5))
```

mode

- Bus
- Commuter Rai
- Heavy Rail
- Light Rail

## Grouped barplots

First let us consider just the data for Boat and Trackless Trolley.

```
data_boat_trlessTroll <- mbta_tidy %>%  
  group_by(mode, month) %>%  
  summarize(average_nr_passengers = mean(NrPassengers)) %>%  
  filter(mode %in% c("Boat", "Trackless Trolley"))
```

Now we will produce stacked bars plot.

```
data_boat_trlessTroll%>%
  ggplot(aes(x = month, y = average_nr_passengers, fill = mode)) +
  geom_bar(stat = "identity") + coord_flip() +
  geom_text(aes(label=round(average_nr_passengers, 2)), position = position_stack(0.5))
```

- ▶ In order to produce grouped bars plot we add `position = position_dodge()` as an argument to `geom_bar()`.
- ▶ If you want labels, use `position_dodge()` instead of `position_stack()` in `geom_text()`.
- ▶ `vjust` and `hjust` move the labels vertically and horizontally.

```
data_boat_trlessTroll %>%
  ggplot(aes(x = month, y = average_nr_passengers, fill = mode)) +
  geom_bar(stat = "identity", position = position_dodge()) +
  geom_text(aes(label=round(average_nr_passengers, 1)), position = position_dodge(0.5), vjust = 1.5,
            hjust = .5, size=3)
```
